

« Absence of evidence is evidence of absence »

« The p-value is the probability of my null hypothesis given my collected data »

« $p > 0.05$ means there is no difference between my groups »

« The larger the p-value, the greater the difference between my groups »

« 0.051 is radically different than 0.049 »

« Absence of evidence is NOT evidence of absence »

« The p-value is the probability of observing my data if my null hypothesis is true »

« $p > 0.05$ simply means: no difference was demonstrated »

« The p-value is not an effect size »

« The difference between $p = 0.049$ and $p = 0.051$ is two thousandths, not a scientific revolution »
